

**Drywall goes
up Thursday.
What it hides is
permanent.**

What's inside

- — **Pre drywall window**
- — **The inspector myth**
- — **Two visits, not one**
- — **Blue tape day**
- — **Month eleven**

The Pre Drywall Window

Before the walls close, every wire, pipe, duct and brace is sitting there in the open.

The day sheetrock goes up, all of it is sealed in for the life of the house.

You will not see it again until something leaks or trips.

You are told it already passed.

That Stamp Is Not For You

The city inspector is checking code minimum on behalf of the city.

He is on site for minutes and he is not looking out for your future repair bill.

Passing and built well are two different results.

One phone call changes that.

Two Visits, Not One

Hire your own independent inspector at frame stage, then again before closing.

It runs a few hundred per visit and it is the cheapest money you will spend on the house.

The builder cannot keep you out. They will just act like nobody asks.

Then comes the day everyone rushes.

Blue Tape Is Not A List

At the final walkthrough they hand you tape and you mark scuffs and nail pops.

Tape on a wall is not a promise. It falls off and it proves nothing.

Get every item written, numbered and signed with a date next to it.

The clock is already running.

Month Eleven

Most builder warranties on the small stuff run twelve months from closing.

A full season of heat, cold and settling shows you what the house actually does.

Bring your inspector back one more time while it is still their problem.

Most people miss it by weeks.

CHECKLIST

and I'll DM you

the new build inspection checklist I hand my buyers. Exactly what to look at before drywall, what to write down at the final walkthrough, and the items to chase before your warranty year quietly ends.

Save this for later.
